SUBASRI S(7376241CS414)

PROBLEM STATEMENT: EDU-12- STUDENT QUERY INTENT CLASSIFICATION

Work Flow :

Technology Stack :

Frontend

- **HTML5** – Creates the web page structure
- **CSS3** – Designs the interface
- **JavaScript** – Sends the student's question to the backend and displays the result

Backend

- **Python** – Main programming language
- **Flask** – Connects the frontend with the machine-learning model and handles requests

Machine Learning

- **Scikit-learn** – Machine-learning library
- **TF-IDF Vectorizer** – Converts text questions into numerical features
- **Logistic Regression** – Classifies the student's question
- **One-vs-Rest (OvR)** – Allows multiple intents to be predicted from one question
- **MultiLabelBinarizer** – Converts multiple intent labels into machine-readable form

Data Processing

- **Pandas** – Reads and processes the CSV dataset
- **CSV Dataset** – Contains training questions and their intent labels

Model Storage

- **Pickle (model.pkl)** – Stores the trained ML model so it can be loaded by Flask without retraining every time.

Database

- **SQLite** – Stores structured application/training data in a local .db file.

DBMS Basics

Recommended Actions

- Provide a simple definition and key points.
- Provide a step-by-step explanation.
- Provide a practical example.

Frequently Asked Questions

Question	Times Asked	Topic
what is mean by normalization in DBMS?	3	Normalization
who is this	1	General
what is normalization in DBMS?	1	Normalization
what is mimc	1	General
what is dbms and explain its types with examples	1	DBMS Basics
what is dbms and explain it with examples	1	DBMS Basics
what id dbms	1	DBMS Basics
I am having difficulty understanding normalization in DBMS. Could you explain the concept of 1NF, 2NF, and 3NF in a simple step-by-step manner, compare the three normal forms, and provide a suitable example showing how an unnormalized table can be converted into a normalized table?	1	Normalization
I am confused about the difference between processes and threads in operating systems. Please explain both concepts in a simple way, compare their memory usage, execution, and communication, and give practical examples of situations where processes and threads are used.	1	General
